1 Setup & Scripts

1.1 CMake

```

1 cmake_minimum_required(VERSION 3.14)
2 project(olymp)
3
4 set(CMAKE_CXX_STANDARD 17)
5 add_compile_definitions(LOCAL)
6 #set(CMAKE_CXX_FLAGS "${CMAKE_CXX_FLAGS}
  ↪ -fsanitize=undefined -fno-sanitize-recover")
7 #sanitizers: address, leak, thread, undefined, memory
8
9 add_executable(olymp f.cpp)

```

1.2 wipe.sh

```

1 touch {a..l}.cpp
2
3 for file in *.cpp ; do
4     cat template.cpp > $file ;
5 done

```

1.3 Stack size & Profiling

```

1 # Print stack limit in Kb
2 ulimit -s
3
4 # Set stack limit in Kb, session-local, so resets after
  ↪ terminal restart
5 ulimit -S -s 131072
6
7 # Profile time
8 time ./olymp

```

9

```

10 # Profile time, memory, etc.
11 # Make sure to use the full path
12 /usr/bin/time -v ./olymp

```

2 Language specific

2.1 C++

2.1.1 G++ builtins

- `__builtin_popcount(x)` — количество единичных бит в двоичном представлении 32-битного (знакового или беззнакового) целого числа.
- `__builtin_popcountll(x)` — то же самое для 64-битных типов.
- `__builtin_ctz(x)` — количество нулей на конце двоичного представления 32-битного целого числа. Например, для 5 вернётся 0, для $272 = 256 + 16$ — 4 и т. д. Может не работать для нуля (вообще не стоит вызывать для $x = 0$, по-моему это и упасть может).
- `__builtin_ctzll(x)` — то же самое для 64-битных типов.
- `__builtin_clz(x)` — количество нулей в начале двоичного представления 32-битного целого числа. Например, для 2^{31} или -2^{31} вернётся 0, для 1 — 31 и т. д. Тоже не надо вызывать с $x = 0$.
- `__builtin_clzll(x)` — то же самое для 64-битных типов.
- `bitset<N>._Find_first()` — номер первой позиции с единицей в битсете или его размер (то есть N), если на всех позициях нули.

- `bitset<N>._Find_next(x)` — номер первой позиции с единицей17 среди позиций с номерами строго больше x ; если такой нет,18 то N .

2.1.2 Custom Hash

```

1 namespace std {
2 template <
3 struct hash<pnt> {
4     std::size_t operator()(pnt const &s) const noexcept {
5         return std::hash<ll>{}(s.first * ll(1ull << 32u) +
6             s.second);
7     }
8 };
9 } // namespace std

```

2.1.3 Allocator

```

1 template <size_t sz>
2 class chunk_alloc {
3 public:
4     static constexpr auto chunk_size = sz;
5
6 private:
7     using chunk_t = array<byte, chunk_size>;
8
9     deque<chunk_t> mem;
10    stack<void*> emp;
11
12 public:
13    void* allocate() {
14        if (emp.empty())
15            emp.push(
16                reinterpret_cast<void*>(&mem.emplace_back()));

```

```

17        auto ans = emp.top();
18        emp.pop();
19
20
21        return ans;
22    }
23
24    void deallocate(void* p) noexcept { emp.push(p); }
25 };
26
27 chunk_alloc<64> pool;
28
29 template <class T>
30 struct dummy_alloc {
31     using value_type = T;
32
33     dummy_alloc() noexcept = default;
34
35     template <class U>
36     explicit dummy_alloc(const dummy_alloc<U> &) noexcept {}
37
38     T* allocate(std::size_t n) {
39         if constexpr (sizeof(value_type) ==
40             decltype(pool)::chunk_size)
41             return static_cast<T*>(pool.allocate());
42         else
43             return static_cast<T*>(
44                 ::operator new(n * sizeof(value_type)));
45     }
46
47     void deallocate(T* p, std::size_t n) {
48         if constexpr (sizeof(value_type) ==
49             decltype(pool)::chunk_size)

```

```

50     return pool.deallocate(p);
51     else
52         ::delete (p);
53 }
54 };
55
56 template <class T, class U>
57 constexpr bool operator=(
58     const dummy_alloc<T> &,
59     const dummy_alloc<U> &) noexcept {
60     return true;
61 }
62
63 template <class T, class U>
64 constexpr bool operator!=(
65     const dummy_alloc<T> &,
66     const dummy_alloc<U> &) noexcept {
67     return false;
68 }

```

2.2 Python

```

1  # stack size
2  import sys
3
4  sys.setrecursionlimit(10**6)
5
6  # memoize
7  import functools
8
9  @functools.lru_cache(maxsize=None)

```

3 Geometry

3.1 Пересечение прямых

$$AB := A - B; CD := C - D$$

$$(A \times B \cdot CD \cdot x - C \times D \cdot AB \cdot x : A \times B \cdot CD \cdot y - C \times D \cdot AB \cdot y : AB \times CD)$$

3.2 Касательные

Точки пересечения общих касательных окружностей с центрами в $(0, 0)$ и $(x, 0)$ равны $\frac{xr_1}{r_1 \pm r_2}$. x координата точек касания из $(x, 0)$ равна $\frac{r^2}{x}$.

3.3 Пересечение полуплоскостей

Точно так же, как в выпуклой оболочке, но надо добавить bounding box (квадратичного размера относительно координат на входе) и завернуть два раза. Ответ можно найти как подотрезок от первой полуплоскости типа true до нее же самой на втором круге. Проверку на вырожденность лучше делать простой проверкой пары-тройки точек из предполагаемого ответа. Стоит быть аккуратнее с точностью.

3.4 Формулы

Площадь поверхности сферы $4\pi R^2$. Объем шара $\frac{4}{3}\pi R^3$. Площадь шапки $2\pi Rh$, объем $\frac{\pi h(3a^2 + h^2)}{6}$, где h — высота, a — радиус шапки. Объем тетраэдра $\frac{1}{6}$ на определитель. В общем случае площадь S_{n-1} и объем V_n шарика в \mathbb{R}^n можно найти по формуле $S_{n-1} = nC_n R^{n-1}$, $V_n = C_n R^n$, где $C_n = \frac{\pi^{\frac{n}{2}}}{\Gamma(\frac{n}{2} + 1)}$. Или альтернативно $C_{2k} = \frac{\pi^k}{k!}$, $C_{2k+1} = \frac{2^{k+1}\pi^k}{(2k+1)!!}$. Также, должны быть верны формулы $\frac{V_n}{S_{n-1}} = \frac{R}{n}$, $\frac{S_{n+1}}{V_n} = 2\pi R$.

4 Numbers

A lot of divisors

- $\leq 20 : d(12) = 6$
- $\leq 50 : d(48) = 10$
- $\leq 100 : d(60) = 12$
- $\leq 10^3 : d(840) = 32$
- $\leq 10^4 : d(9240) = 64$
- $\leq 10^5 : d(83160) = 128$
- $\leq 10^6 : d(720720) = 240$
- $\leq 10^7 : d(8648640) = 448$
- $\leq 10^8 : d(91891800) = 768$
- $\leq 10^9 : d(931170240) = 1344$
- $\leq 10^{11} : d(97772875200) = 4032$
- $\leq 10^{12} : d(963761198400) = 6720$
- $\leq 10^{15} : d(866421317361600) = 26880$
- $\leq 10^{18} : d(897612484786617600) = 103680$

Numeric integration

- simple: $F(0)$
- simpson: $\frac{F(-1)+4 \cdot F(0)+F(1)}{6}$
- runge2: $\frac{F(-\sqrt{\frac{1}{3}})+F(\sqrt{\frac{1}{3}})}{2}$
- runge3: $\frac{F(-\sqrt{\frac{3}{5}}) \cdot 5 + F(0) \cdot 8 + F(\sqrt{\frac{3}{5}}) \cdot 5}{18}$

5 Graphs

5.1 Weighted matroid intersection

```

1 // here we use T = __int128 to store the independent set
2 // calling expand k times to an empty set finds the maximum
3 // cost of the set with size exactly k,
4 // that is independent in blue and red matroids
5 // ver is the number of the elements in the matroid,
6 // e[i].w is the cost of the i-th element
7 // first return value is new independent set
8 // second return value is difference between
9 // new and old costs
10 // oracle(set, red) and oracle(set, blue) check whether
11 // or not the set lies in red or blue matroid respectively
12 auto expand = [&](T in) → T {

10.2 Circulation

Можно делать алгоритм Клейна: пушим отрицательные циклы, пока они есть. ММСС: бинарным поиском в Фордом-Беллмановом ищем отрицательный цикл минимального среднего веса, по нему пушим Capacity Scaling: идем по битам от больших к меньшим, добавляем по одному ребру. Один шаг такого алгоритма похож на один шаг минкоста с Дейкстрой с потенциалами.
