1 Setup & Scripts

1.1 CMake

1.2 wipe.sh

```
1 touch {a..l}.cpp
2
3 for file in ?.cpp ; do
4    cat template.cpp > $file ;
5 done
```

1.3 Stack size & Profiling

```
11 # Make sure to use the full path
```

12 /usr/bin/time -v ./olymp

2 Language specific

2.1 C++

2.1.1 G++ builtins

- __builtin_popcount(x) количество единичных бит в двоичном представлении 32-битного (знакового или беззнакового) целого числа.
- __builtin_popcountll(x) то же самое для 64-битных типов.
- __builtin_ctz(x) количество нулей на конце двоичного представления 32-битного целого числа. Например, для 5 вернётся 0, для 272 = 256 + 16 4 и т. д. Может не работать для нуля (вообще не стоит вызывать для x = 0, по-моему это и упасть может).
- __builtin_ctzll(x) то же самое для 64-битных типов.
- __builtin_clz(x) количество нулей в начале двоичного представления 32-битного целого числа. Например, для 2^{31} или -2^{31} вернётся 0, для 1 31 и т. д. Тоже не надо вызвывать с x = 0.
- __builtin_clzll(x) то же самое для 64-битных типов.
- bitset<N>._Find_first() номер первой позиции с единицей в битсете или его размер (то есть N), если на всех позициях нули.
- bitset<N>._Find_next(x) номер первой позиции с единицей среди позиций с номерами строго больше x; если такой нет, то N.

2.1.2 Custom Hash

```
1 namespace std {
2 template 
3 struct hash
```

```
4
      std::size_t operator()(pnt const &s) const noexcept {
                                                                        28
                                                                            template <class T>
        return std::hash<ll>{}(s.first * ll(1ull << 32u) +</pre>
                                                                             struct dummy_alloc {
 5
                                                                        29
 6
                               s.second);
                                                                               using value type = T;
                                                                        30
 7
                                                                        31
 8
    }:
                                                                        32
                                                                               dummy alloc() noexcept = default;
   } // namespace std
                                                                        33
                                                                        34
                                                                               template <class U>
                                                                               explicit dummy_alloc(const dummy_alloc<U> ♂) noexcept {}
                                                                        35
  2.1.3 Allocator
                                                                        36
 1 template <size_t sz>

24
    };
                                                                        60
25
                                                                        61 template <class T, class U>
26
    chunk alloc<64> pool;
                                                                        62 constexpr bool operator≠(const dummy_alloc<T> δ,
27
```

```
const dummy_alloc<U> 8) noexcept {
64 return false;
65 }
```

2.2 Python

```
1  # stack size
2  import sys
3
4  sys.setrecursionlimit(10**6)
5
6  # memoize
7  import functools
8
9  @functools.lru_cache(maxsize=None)
```

3 Geometry

3.1 Пересечение прямых

$$AB := A - B; CD := C - D$$

$$(A \times B \cdot CD.x - C \times D \cdot AB.x : A \times B \cdot CD.y - C \times D \cdot AB.y : AB \times CD)$$

3.2 Касательные

Точки пересечения общих касательных окружностей с центрами в (0,0) и (x,0) равны $\frac{xr_1}{r1\pm r2}$. x координата точек касания из (x,0) равна $\frac{r^2}{x}$.

3.3 Пересечение полуплоскостей

Точно так же, как в выпуклой оболочке, но надо добавить bounding box (квадратичного размера относительно координат на входе) и завернуть два раза. Ответ можно найти как подотрезок от первой полуплоскости типа true до нее же самой на втором круге. Проверку на

вырожденность лучше делать простой проверкой пары-тройки точек из предполагаемого ответа. Стоит быть аккуратнее с точностью.

3.4 Формулы

Площадь поверхности сферы $4\pi R^2$. Обьем шара $\frac{4}{3}\pi R^3$. Площадь шапки $2\pi Rh$, обьем $\frac{\pi h(3a^2+h^2)}{6}$, где h — высота, a — радиус шапки. Объем тетраэдра $\frac{1}{6}$ на определитель. В общем случае площадь S_{n-1} и объем V_n шарика в \mathbb{R}^n можно найти по формуле $S_{n-1}=nC_nR^{n-1}$, $V_n=C_nR^n$, где $C_n=\frac{\pi^{\frac{n}{2}}}{\Gamma(\frac{n}{2}+1)}$. Или альтернативно $C_{2k}=\frac{\pi^k}{k!}$, $C_{2k+1}=\frac{2^{k+1}\pi^k}{(2k+1)!!}$. Также, должны быть верны формулы $\frac{V_n}{S_{n-1}}=\frac{R}{n}$, $\frac{S_{n+1}}{V_n}=2\pi R$.

10.2 Circulation

Можно делать алгоритм Клейна: пушим отрицательные циклы, пока они есть. ММСС: бинпоиском в Фордом-Беллманом ищем отрицательный цикл минимального среднего веса, по нему пушим. Capacity Scaling: идем по битам от больших к меньшим, добавляем по одному ребру. Один шаг такого алгоритма похож на один шаг минкоста с Дейкстрой с потенциалами.

10.3 Global Min-Cut

```
