1.2 CMake

1.3 Stack size & Profiling

2 Language specific

2.1 C++

2.1.1 G++ builtins

• _builtin_popcount(x) — количество единичных бит в двоичном представлении 32-битного (знакового или беззнакового) целого

числа.

- _builtin_popcountll(x) то же самое для 64-битных типов.
- __builtin_ctz(x) количество нулей на конце двоичного представления 32-битного целого числа. Например, для 5 вернётся 0, для 272 = 256 + 16 4 и т. д. Может не работать для нуля (вообще не стоит вызывать для x = 0, по-моему это и упасть может).
- __builtin_ctzll(x) то же самое для 64-битных типов.
- __builtin_clz(x) количество нулей в начале двоичного представления 32-битного целого числа. Например, для 2^{31} или -2^{31} вернётся 0, для 1 31 и т. д. Тоже не надо вызвывать с x = 0.
- __builtin_clzll(x) то же самое для 64-битных типов.
- bitset<N>._Find_first() номер первой позиции с единицей в битсете или его размер (то есть N), если на всех позициях нули.
- bitset<N>._Find_next(x) номер первой позиции с единицей среди позиций с номерами строго больше x; если такой нет, то N.

2.1.2 Custom Hash

2.1.3 Allocator

```
1 template <size_t sz>
2 class chunk_alloc {
```

```
3
     public:
                                                                        38
                                                                                if constexpr (sizeof(value type) =
      static constexpr auto chunk size = sz;
                                                                        39
                                                                                              decltype(pool)::chunk size)
 4
                                                                                  return static_cast<T *>(pool.allocate());
 5
                                                                        40
 6
     private:
                                                                        41
                                                                                else
                                                                                  return static_cast<T *>(
 7
      using chunk t = array<byte, chunk size>;
                                                                        42
                                                                                      :: operator new(n * sizeof(value type)));

37
                                                                         5
```

- 6 # memoize
- 7 import functools

8

9 @functools.lru cache(maxsize=None)

3 Geometry

3.1 Пересечение прямых

$$AB := A - B$$
; $CD := C - D$

$$(A \times B \cdot CD.x - C \times D \cdot AB.x : A \times B \cdot CD.y - C \times D \cdot AB.y : AB \times CD)$$

3.2 Касательные

Точки пересечения общих касательных окружностей с центрами в (0,0) и (x,0) равны $\frac{xr_1}{r1\pm r2}$. x координата точек касания из (x,0) равна $\frac{r^2}{x}$.

3.3 Пересечение полуплоскостей

Точно так же, как в выпуклой оболочке, но надо добавить bounding box (квадратичного размера относительно координат на входе) и завернуть два раза. Ответ можно найти как подотрезок от первой полуплоскости типа true до нее же самой на втором круге. Проверку на вырожденность лучше делать простой проверкой пары-тройки точек из предполагаемого ответа. Стоит быть аккуратнее с точностью.

3.4 Формулы

Площадь поверхности сферы $4\pi R^2$. Обьем шара $\frac{4}{3}\pi R^3$. Площадь шапки $2\pi Rh$, обьем $\frac{\pi h(3a^2+h^2)}{6}$, где h — высота, a — радиус шапки. Объем тетраэдра $\frac{1}{6}$ на определитель. В общем случае площадь S_{n-1} и объем V_n шарика в \mathbb{R}^n можно найти по формуле $S_{n-1}=nC_nR^{n-1}$, $V_n=C_nR^n$, где $C_n=\frac{\pi^{\frac{n}{2}}}{\Gamma(\frac{n}{2}+1)}$. Или альтернативно $C_{2k}=\frac{\pi^k}{k!}$, $C_{2k+1}=\frac{2^{k+1}\pi^k}{(2k+1)!!}$. Также, должны быть верны формулы $\frac{V_n}{S_{n-1}}=\frac{R}{n}$, $\frac{S_{n+1}}{V_n}=2\pi R$.

4 Numbers

A lot of divisors

- $\bullet \le 20 : d(12) = 6$
- $\bullet \le 50 : d(48) = 10$
- $\bullet \ \le 100: d(60) = 12$
- $\bullet \le 10^3 : d(840) = 32$
- $\bullet \le 10^4 : d(9240) = 64$
- $\bullet \le 10^5 : d(83160) = 128$
- $\bullet \le 10^6 : d(720720) = 240$
- $\bullet \le 10^7 : d(8648640) = 448$
- $\bullet \le 10^8 : d(91891800) = 768$
- $\bullet \le 10^9 : d(931170240) = 1344$
- $\bullet \le 10^{11} : d(97772875200) = 4032$
- $\bullet \le 10^{12} : d(963761198400) = 6720$
- $\bullet \le 10^{15} : d(866421317361600) = 26880$
- $\bullet < 10^{18} : d(897612484786617600) = 103680$

Numeric integration

- simple: F(0)
- simpson: $\frac{F(-1)+4\cdot F(0)+F(1)}{6}$
- runge2: $\frac{F(-\sqrt{\frac{1}{3}})+F(\sqrt{\frac{1}{3}})}{2}$
- runge3: $\frac{F(-\sqrt{\frac{3}{5}})\cdot 5+F(0)\cdot 8+F(\sqrt{\frac{3}{5}})\cdot 5}{18}$

5 Graphs

5.1 Weighted matroid intersection

```

10.2 Circulation

Можно делать алгоритм Клейна: пушим отрицательные циклы, пока они есть. ММСС: бинпоиском в Фордом-Беллманом ищем отрицательный цикл минимального среднего веса, по нему пушим. Capacity Scaling: идем по битам от больших к меньшим, добавляем по одному ребру. Один шаг такого алгоритма похож на один шаг минкоста с Дейкстрой с потенциалами.

10.3 Global Min-Cut

```
