## 1 Setup & Scripts

### 1.1 CMake

## 1.2 wipe.sh

```
1 touch {a..l}.cpp
2
3 for file in ?.cpp; do
4    cat template.cpp > $file;
5 done
```

## 1.3 Stack size & Profiling

9
10 # Profile time, memory, etc.
11 # Make sure to use the full path
12 /usr/bin/time -v ./olymp

## 2 Language specific

### 2.1 C++

#### **2.1.1** G++ builtins

- \_\_builtin\_popcount(x) количество единичных бит в двоичном представлении 32-битного (знакового или беззнакового) целого числа.
- \_\_builtin\_popcountll(x) то же самое для 64-битных типов.
- \_\_builtin\_ctz(x) количество нулей на конце двоичного представления 32-битного целого числа. Например, для 5 вернётся 0, для 272 = 256 + 16 4 и т. д. Может не работать для нуля (вообще не стоит вызывать для x = 0, по-моему это и упасть может).
- \_\_builtin\_ctzll(x) то же самое для 64-битных типов.
- \_\_builtin\_clz(x) количество нулей в начале двоичного представления 32-битного целого числа. Например, для  $2^{31}$  или  $-2^{31}$  вернётся 0, для 1 31 и т. д. Тоже не надо вызвывать с x=0.
- \_\_builtin\_clzll(x) то же самое для 64-битных типов.
- ullet bitset<N>.\_Find\_first() номер первой позиции с единицей в битсете или его размер (то есть N), если на всех позициях нули.

ullet bitset<N>.\_Find\_next(x) — номер первой позиции с единицей среди позиций с номерами строго больше x; если такой нет, то N.

#### 2.1.2 hash

## 2.2 Python

```
1  # stack size
2  import sys
3
4  sys.setrecursionlimit(10**6)
5
6  # memoize
7  import functools
8
9  @functools.lru_cache(maxsize=None)
```

## 3 Geometry

### 3.1 Пересечение прямых

$$AB \coloneqq A - B; CD \coloneqq C - D$$
 
$$(A \times B \cdot CD.x - C \times D \cdot AB.x : A \times B \cdot CD.y - C \times D \cdot AB.y : AB \times CD)$$

### 3.2 Касательные

Точки пересечения общих касательных окружностей с центрами в (0,0) и (x,0) равны  $\frac{xr_1}{r1\pm r2}$ . x координата точек касания из (x,0) равна  $\frac{r^2}{x}$ .

## 3.3 Пересечение полуплоскостей

Точно так же, как в выпуклой оболочке, но надо добавить bounding box (квадратичного размера относительно координат на входе) и завернуть два раза. Ответ можно найти как подотрезок от первой полуплоскости типа true до нее же самой на втором круге. Проверку на вырожденность лучше делать простой проверкой пары-тройки точек из предполагаемого ответа. Стоит быть аккуратнее с точностью.

## 4 Numbers

• A lot of divisors

$$- \le 20 : d(12) = 6$$

$$- \le 50 : d(48) = 10$$

$$- \le 100 : d(60) = 12$$

$$- \le 10^3 : d(840) = 32$$

$$- \le 10^4 : d(9240) = 64$$

```
- < 10^5 : d(83160) = 128
                                                                      9 // new and old costs
                                                                     10 // oracle(set, red) and oracle(set, blue) check whether
           - < 10^6 : d(720720) = 240
                                                                     11 // or not the set lies in red or blue matroid respectively
