#### 2.1 C++

#### **2.1.1** G++ builtins

- \_\_builtin\_popcount(x) количество единичных бит в двоичном представлении 32-битного (знакового или беззнакового) целого числа.
- \_\_builtin\_popcountll(x) то же самое для 64-битных типов.
- \_\_builtin\_ctz(x) количество нулей на конце двоичного представления 32-битного целого числа. Например, для 5 вернётся 0, для 272 = 256 + 16 4 и т. д. Может не работать для нуля (вообще не стоит вызывать для x = 0, по-моему это и упасть может).
- \_\_builtin\_ctzll(x) то же самое для 64-битных типов.
- \_\_builtin\_clz(x) количество нулей в начале двоичного представления 32-битного целого числа. Например, для  $2^{31}$  или  $-2^{31}$  вернётся 0, для 1 31 и т. д. Тоже не надо вызвывать с x=0.
- \_\_builtin\_clzll(x) то же самое для 64-битных типов.
- bitset<N>.\_Find\_first() номер первой позиции с единицей в битсете или его размер (то есть N), если на всех позициях нули.
- bitset<N>.\_Find\_next(x) номер первой позиции с единицей среди позиций с номерами строго больше x; если такой нет, то N.

```
2.1.2 Custom Hash
                                                                 21
                                                                         return ans;

64
65
      return false;
66
```

## 2.2 Python

```
1  # stack size
2  import sys
3
4  sys.setrecursionlimit(10**6)
5
6  # memoize
7  import functools
8
9  @functools.lru_cache(maxsize=None)
```

# 3 Geometry

## 3.1 Пересечение прямых

$$AB := A - B; CD := C - D$$

$$(A \times B \cdot CD.x - C \times D \cdot AB.x : A \times B \cdot CD.y - C \times D \cdot AB.y : AB \times CD)$$

#### 3.2 Касательные

Точки пересечения общих касательных окружностей с центрами в (0,0) и (x,0) равны  $\frac{xr_1}{r1\pm r2}$ . x координата точек касания из (x,0) равна  $\frac{r^2}{x}$ .

# 3.3 Пересечение полуплоскостей

Точно так же, как в выпуклой оболочке, но надо добавить bounding box (квадратичного размера относительно координат на входе) и завернуть два раза. Ответ можно найти как подотрезок от первой полуплоскости типа true до нее же самой на втором круге. Проверку на вырожденность лучше делать простой проверкой пары-тройки точек из предполагаемого ответа. Стоит быть аккуратнее с точностью.

# 4 Numbers
